Outline

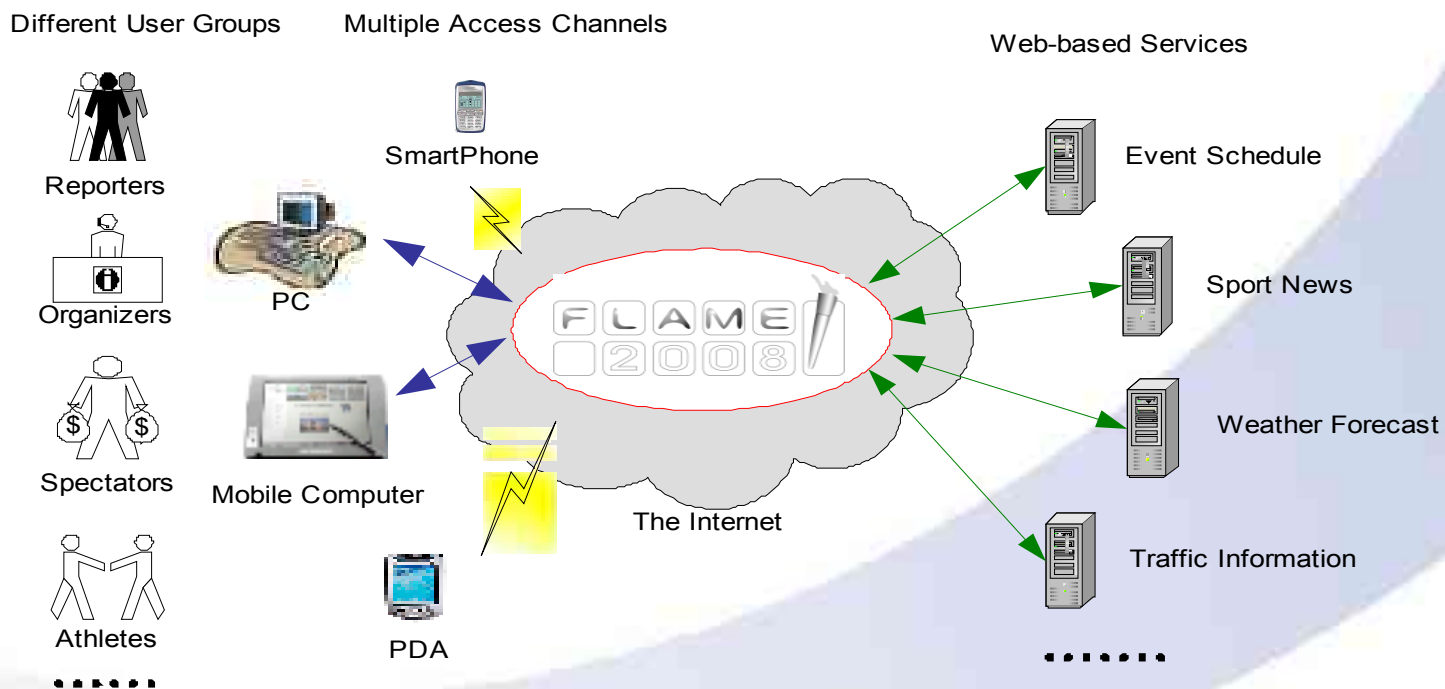

- Background
- Problems Addressed and Objectives
- System Architecture
- Language Design
- Implementation
- Application
- Conclusion and Future Work

Background

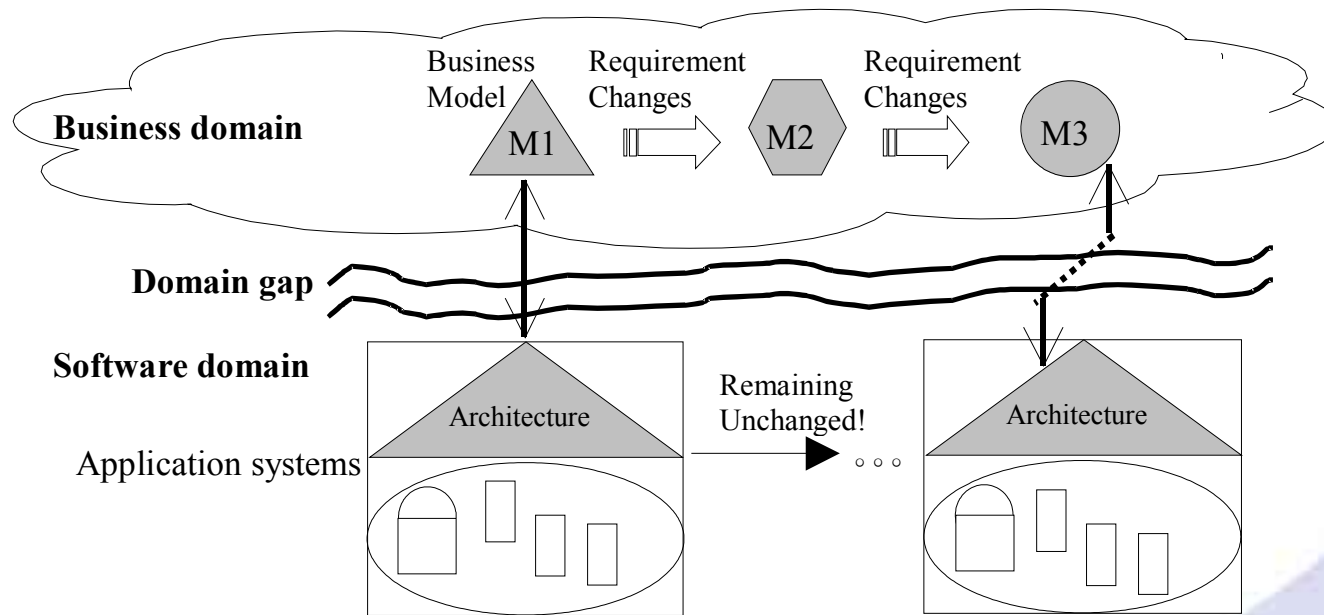

Part of the project “Personalized Web Services Mediation for the Olympic Games 2008 in Beijing”

The project started in March 2002, supported by MOST and BMBF, and is to provide enabling technologies and framework for mediating individual user demand and information services in a just-in-time and context-sensitive manner.

Problems addressed (1)

Model mismatches in the traditional way of information systems development

- **Convergent models – to narrow the gap**

Problems addressed (2)

To enable FLAME2008, we adopted a service-oriented architecture, and used Web Services/Grid Services as the basis. Research is focused on:

- Semantic service community – to set up an enabling infrastructure
- Personalized service configuration (Business-end Programming) – to allow end users to “see” and “assemble” the services available to them

Objectives

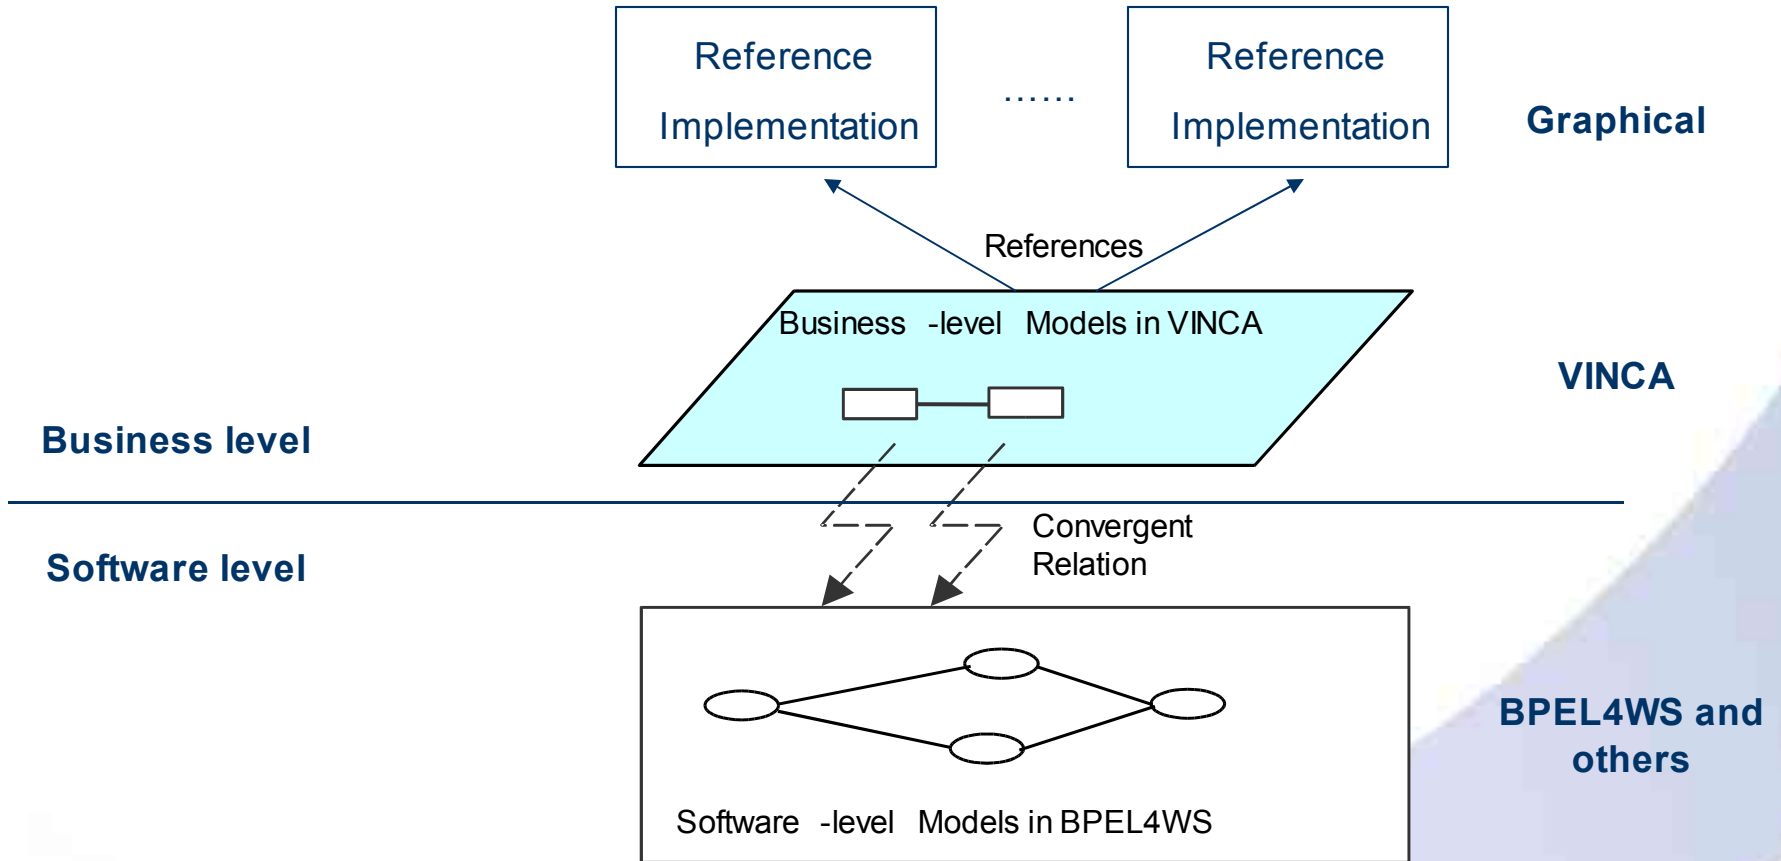

The language VINCA came to life in order to add the following features to service composition language like BPEL4WS:

- **User programmability**
- **Context-awareness**
- **Dynamic (re)composition with QoS insurance**
- **Convergence of Business and Software Level Modeling**

Language Design

Three Abstraction Layers

Language Design

Examples of Reference Representations

Icon	Name
	Alarm
	Business Service
	Composite
	Business Service
	Sequence Link
	Decision Point
	Concurrent Link
	Repeat

Language Design

.vinca “program” is a set of XML files, whose grammatical rules are defined by a set of schema specifications.

VINCA Process

Generated with XMI Spy Schema Editor www.xmispy.com

Difference between VINCA process and BPEL:

- Block-structured with the dimension “time” first and then “logic”
- User context
- Dynamic Binding of Semantic Services that are semantic constructs bound to WSDL descriptions at runtime

User Contexts

User contexts serve as implicit inputs in decision-making and service activation

It is required in FLAME that:

- 1) Context specification: flexible context structure with semantic support**
- 2) Application of user contexts: context-aware process constructs**

Current solution for context awareness:

- Policies for service selection and invocation**
- Overlay in service parameter matching**

Business Services

**Visual Presentation
according to user contexts**

**Refer to – Ontology-based semantic
infrastructure**

**Web services /
Grid services**

Implementation

Application

Conclusion and Future Work

VINCA is driven by the project development of FLAME2008 and is still evolving, some observations and future work:

- Process Patterns and Reuse
- Trusted Service Space
- Service Roaming
- Fully Distributed Infrastructure for FLAME2008
- Personalized VO for scientific computing

Consortium for the digital Olympics initiative under the EU 6th Framework Program
